

CEN 134 Hw (C Sentinel-Controlled Loop Design)

Problem. Write a program with necessary comments that finds the electric consumption of a factory per hour. The program should first ask user how many electric energy does this factory spend. Then the program should ask user how many hours does this factory is actively working. Lastly, the program should calculate the amount of electric consumption per hour. This process should be repeated until the user enters -1 for the amount of electric energy spent.

Homework Policies:

1. Please do not submit this homework and because it will not be graded. If you any questions please see me or your lab. assistants (ask for office hours) at the office hour that is announced on my web site.
